Worksheet for Lab 10!

Question 1: What happens when you swap the delimiter from commas to tabs? How does the preview change?

It's immediately re-parses the raw text file and updates the data preview grid to show how the rows and columns will be split based on the new tab character.

(Make sure "disable live preview is not checked if you don't see a change)

Question 2: Try sorting the scientificName facet by name and by count. What problems are there with the data?

Repetitive data

Question 3: Use faceting to figure out the following:

How many different years are represented in this file?

16

What year occurs the most times?

1978

What year occurs the least number of times?

1993

Questions for Post-Lab Assignment 10!

Question 4: What happens when you make a numerical facet of column note1, then convert the column to numbers? Is something different about the facet compared to yr?

Before converting, `note1` is treated as text, so the numerical facet is mostly blank/non-numeric. After converting to numbers, the histogram is highly concentrated at 13 (a few at 5) with many blanks. `yr` is different: it has a broad, fairly even numeric distribution across many years.

Question 5: Click and drag on the scatterplot facet you made to highlight a rectangle. What happens to the data points being displayed?S

Dragging a rectangle on the scatterplot filters the data. Only rows/points inside the rectangle remain displayed; points outside are hidden.

Question 6: After the last step, some columns are empty. (You can check by text faceting a column) Why? What do you think we can do to fix it?

Some columns look empty because the scatterplot selection is still filtering the rows, and the visible rows have no values in those columns. Fix it by resetting the scatterplot facet or clicking Remove all filters.
